

IN THE ABSTRACT:

Please amend the abstract as follows:

METHOD OF CONFIGURING AN AUTOMATION MODULE ON A TCP/IP NETWORK

~~This invention relates to a~~ A method of configuring an automation module (10) on a TCP/IP network (5) ~~comprising~~ including an assignment step (A) to assign a application name (40) that is unique on the TCP/IP network, ~~memorized~~ stored in the storage means (15) of the automation module, an addressing step (B) in which the automation module sends a request address query (17) containing its application name and ~~conferm~~ in conformance with the DHCP protocol to a DHCP server (23), a configuration step (C) in which the automation module sends a read configuration query (18) to an FTP/TFTP server (24, 34) ~~conferm~~ in conformance with the FTP or TFTP protocol. The DHCP server and the FTP/TFTP server are installed in one or several items of automation equipment (20, 30) connected to the TCP/IP network. ~~The invention also relates to an automation assembly capable of using such a configuration method.~~
